Purple hands in multiple system atrophy
Global anhidrosis with preserved acral sweating

Sweating is shown in purple by the alizarin indicator powder, which was spread evenly over the exposed body surface. Sweating was present over the hands (A) with sparse areas of preserved sweating on the neck and forehead shown in the digitized image (B). Calculated body surface anhidrosis was 94%.

A patient developed parkinsonism at age 60 years followed by autonomic involvement with orthostatic hypotension and urinary incontinence, consistent with multiple system atrophy (MSA). Quantitative sudomotor axon reflex test revealed intact postganglionic sudomotor function, while thermoregulatory sweat test (figure) showed global anhidrosis, indicating a preganglionic/central lesion of sudomotor pathways consistent with MSA. Acral sweating was preserved.

Global anhidrosis with acral sparing is a thermoregulatory sweat pattern observed in MSA. The purple hands may be akin to the cold hands sign in MSA. Mechanistically, this could indicate selective preservation of sympathetic pathways, greater sweat gland density, or denervation supersensitivity affecting the hands.

Elizabeth A. Coon, MD, Robert D. Fealey, MD, Eduardo E. Benarroch, MD, Paola Sandroni, MD, PhD, Phillip A. Low, MD, Wolfgang Singer, MD

From the Mayo Clinic, Rochester, MN.

Author contributions: Dr. Coon: drafting/revising the manuscript for content, study design, analysis or interpretation of data. Dr. Fealey: drafting/revising the manuscript for content, analysis or interpretation of data. Dr. Benarroch: drafting/revising the manuscript for content, analysis or interpretation of data. Dr. Sandroni: drafting/revising the manuscript for content, analysis or interpretation of data. Dr. Low: drafting/revising the manuscript for content, analysis or interpretation of data. Dr. Singer: drafting/revising the manuscript for content, study design, analysis or interpretation of data, study supervision.

Study funding: No targeted funding reported.
